No part of the candidate evidence in this exemplar material may be presented in an external assessment for the purpose of gaining credits towards an NCEA qualification.

91267

Level 2 Mathematics and Statistics, 2016 91267 Apply probability methods in solving problems

KIA NOHO TAKATŪ KI TŌ ĀMUA AO!

9.30 a.m. Thursday 24 November 2016 Credits: Four

Achievement	Achievement with Merit	Achievement with Excellence
Apply probability methods in solving problems.	Apply probability methods, using relational thinking, in solving problems.	Apply probability methods, using extended abstract thinking, in solving problems.

Check that the National Student Number (NSN) on your admission slip is the same as the number at the top of this page.

You should attempt ALL the questions in this booklet.

Make sure that you have Formulae Sheet L2-MATHF.

Show ALL working.

If you need more space for any answer, use the page(s) provided at the back of this booklet and clearly number the question.

Check that this booklet has pages 2–15 in the correct order and that none of these pages is blank.

YOU MUST HAND THIS BOOKLET TO THE SUPERVISOR AT THE END OF THE EXAMINATION.º

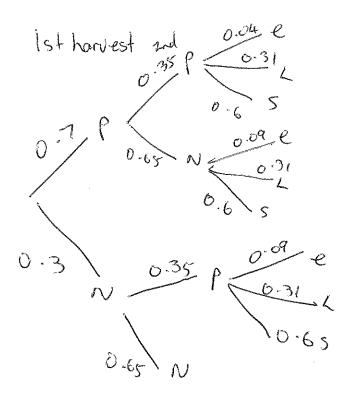

TOTAL 17

QUESTION ONE

(a) The trees in Brookhaven apple orchard are harvested twice a year, as the apples ripen at different times.

Records from previous years have shown that during the first harvest, 70% of apples are picked, while the rest are left. At the second harvest, 35% of the remaining apples are picked, while the rest are not picked.

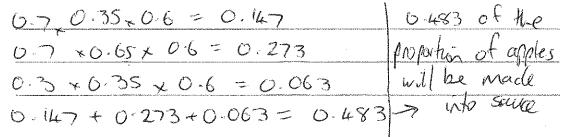

All the apples that are picked go to the packing shed. From each harvest, 9% are selected to be sent for export; 31% are sent for sale on the local market; the rest are sent to a factory to be made into sauce.

(i) Find the probability that a randomly selected apple will not be picked.

0-195 that a random apple will not be picked

(ii) What proportion of apples will be sent to the factory to be made into sauce?

Mathematics and Statistics 91267, 2016

(iii)	If an apple is sold on the local market, then what is the probability that it will have been from the first harvest? What we want forted forse it it is
	(Sold on Local market) fotal possibilities
	First harvest
	$0.7 \times 0.35 \times 0.31 = 0.07595$
	0.7 + 0.65 +0.31 = 0-14105 0.7 +6.31
	D 0.07595 + 0.14105 = 0.217 0.217
(iv)	There are 120 apples in an export carton. If 172 export cartons are produced, then how many apples were there in the total crop?
	120 × 172 = 20640
	20640 apples would be in
	the total crop

ASSESSOR'S

(b) At the Pipsy Galore orchard only two varieties of apple, Jazz and Beauty, are grown.

Twice as many Jazz apples as Beauty apples are grown.

Table 1 below shows the proportions of each variety of apple that have been picked after both harvests have been completed.

Table 1

	Picked	Not picked	
Jazz	0.85	0.15	
Beauty	0.95	0.05	

Table 2 shows the proportion of **picked** apples for each variety that are exported, sold locally, or sent to the factory.

Table 2

	Export	Local	Factory	_ a
Jazz	0.12	0.58	0.3	
Beauty	0.15	0.7	0.15	
	0.27	1.28	0.45	7 2 1

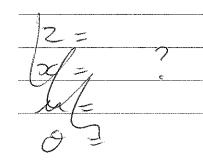

(i) What is the probability that an apple selected at random from the **total crop** will be of the Jazz variety and will be sent to the factory?

The probability of a rondom selected apple of the total crop being a Jazz and sent to the factory is 0-15.

By showing calculations to support your answer, determine if this condition can be met.

QUESTION TWO

Crisp Orchard has two blocks of land where apples are grown. Apples from the larger block are grown by conventional methods, while in the other block they are grown organically.

A random sample of 1200 apples is taken over both blocks and tested for disease. The results are summarised in Table 3 below.

Table 3

	Conventional	Organic	Total
Diseased	122	58	180
Not diseased	518	502	1020
Total	640	560	1200

(a) (i) What proportion of apples in the sample were diseased?

180 = 0-15 were disposed

(ii) What proportion of the diseased apples were conventionally grown?

122 = 0.190625 Wee diseased and onventionally grown.

(iii) If there was a total of 171 000 organic apples grown, then based on this sample, how many apples would be expected to be grown conventionally and be diseased?

122 = 0.190625 640 0.190625 + 171000 = 32596.875

The grown convertionally and he directed to be

(iv) It is claimed that apples that are conventionally grown are at least twice as likely to be diseased as apples that are grown organically.

State whether you agree with this claim, showing full calculations to support your answer.

122/640 = 0.190625 All conventionally (diseased)

58 = 0.1035714286 (organic diseased)

0.190625 0-1035714286 = 1.840 (3.dp)

This statement has claimed convertionally grown apples are at least twice as likely to be discussed as organic apples now I have done the calculations and it is achially 1-8 times more likely which is quite close to 2 times more likely as so I would say I agree with this statement because 1-8 is closer to 2 than 1

ASSESSOR'S USE ONLY

(b) Jazz and Beauty varieties are grown in both blocks.

(i)

From the same sample of 1200 apples in part (a), 890 apples were of the Jazz variety. It was also found that 182 of the Beauty variety were not diseased.

Table 3 from part (a) is repeated here to help you answer the questions that follow.

Table 3

	Conventional	Organic	Total
Diseased	122	58	180
Not diseased	518	502	1020
Total	640	560	1200

What proportion of apples in the sample were of the Jazz variety and diseased? 56AUT TOTAL 180 158 52 Diseased 1020 182 838 1200 890 310

Can this claim be supported?

Give calculations of absolute and relative risks to support your answer.

JAZZ /diseased = 52/890 > 0.05842696629 Beauty / diseased = 128 > 0.4129032258

6.05842696629 + 0.4129032258

= 0.4713301921 Conventinal / diseased = 122 > 0.190125 Organically / diseased = 58/500 > 0.1035714286

0-190625-+0-1035714286 = 0.2941964286

Voriety / diseased conventionally /argonically diseased

0-4713301921 = 1-602093521

6.2941964286 = 1.6 (1.dp)

This claim can be supported because I have done the calculation's and it is 1.6 times more likely that it depends on the variety of apples to get the disease rather than if the apples are againfully convertionally grown.

QUESTION THREE

Apples are sent to a factory to be made into sauce, then bottled.

Testing has shown that, when the bottling machine is operating correctly, the weight of sauce dispensed into a bottle can be taken to be normally distributed, with mean 310 grams and standard deviation 4.5 grams.

(a) (i) Find the probability that a randomly selected bottle will contain between 310 and 316 grams of sauce.

M = 310. lower = >10

4.5 Wiper - 346

the probability that a randomly selected bottle will contain 310-316 grams of source

(ii) The label on the sauce bottle states that the contents weigh 300 grams. Bottles that contain less than 300 grams are considered to be under-weight.

What percentage of bottles would be expected to be under-weight?

M=310 lower = -100000

0=4.5 upper = 300

= 0 013 x 100 = 1.3

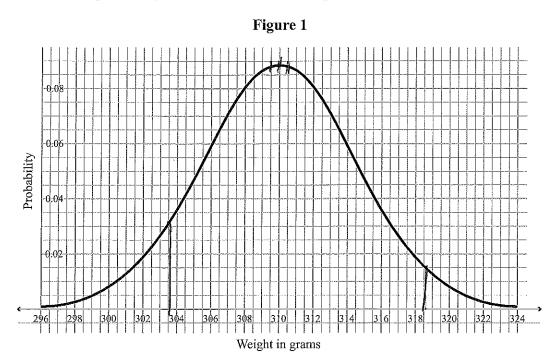

-> 1.306 of apple source bottles would

Mathematics and Statistics 91267, 2016

(iii)	A quality control process identifies bottles of sauce that have contents that are over- weight.
	When the machine is functioning correctly, no more than one bottle in 20 is overweight.
n'	If more than one in 20 bottles are over-weight, then the machine must be adjusted.
0.05	How many grams of sauce will a bottle contain before it is considered over-weight?
	10 = 0.05 O = 4.5
	M = 300
	0.05×100 = 5%
	* fail = left right
	area = 0.05
	= 317.40 (Zdp)
	The sauce bottle will contain approximately 317 grams before considered over weight
(iv)	The quality control process involves taking a random sample of three successive bottles and measuring the weights of their contents. If more than one of the bottles is found to be over-weight or under-weight, then the machine is checked for possible adjustment.
	After taking a random sample, what is the probability that the machine is checked?
	2/9-m
	as As
Í	2-13-3/6 2-145 0 44
	0.98 chance machine checked -
	,

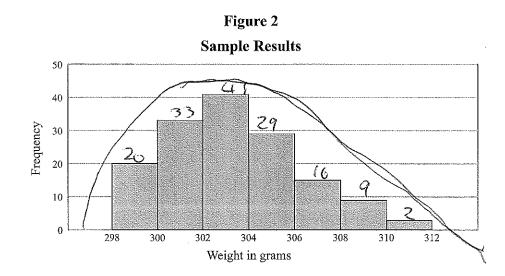

(b) If the bottling machine was operating correctly, the weight of sauce dispensed into a bottle would have a probability distribution similar in shape to the one in Figure 1 below.

ASSESSOR'S USE ONLY

A new bottling machine is installed.

A random sample is taken of the contents of 150 bottles to test the new machine. The results are shown in the frequency histogram in Figure 2 below.

(i) What proportion of bottles in the sample had contents that were under-weight (i.e. the contents weighed less than 300 grams)?

20 sauce bottles weighed less than 300 grams.

(ii) Compare the probability distribution with the frequency histogram that was obtained from the results of the sample.

ASSESSOR'S USE ONLY

In your answer, you should consider the shape, centre, and spread of both distributions and provide numerical evidence.
