Level 3 Chemistry, 2017

KIA NOHO TAKATŪ KI TŌ ĀMUA AO!

91390 Demonstrate understanding of thermochemical principles and the properties of particles and substances

2.00 p.m. Wednesday 15 November 2017 Credits: Five

Achievement	Achievement with Merit	Achievement with Excellence
Demonstrate understanding of thermochemical principles and the properties of particles and substances.	Demonstrate in-depth understanding of thermochemical principles and the properties of particles and substances.	Demonstrate comprehensive understanding of thermochemical principles and the properties of particles and substances.

Check that the National Student Number (NSN) on your admission slip is the same as the number at the top of this page.

You should attempt ALL the questions in this booklet.

A periodic table is provided on the Resource Sheet L3–CHEMR.

If you need more room for any answer, use the extra space provided at the back of this booklet and clearly number the question.

Check that this booklet has pages 2–11 in the correct order and that none of these pages is blank.

YOU MUST HAND THIS BOOKLET TO THE SUPERVISOR AT THE END OF THE EXAMINATION.

TOTAL 15

QUESTION ONE

(a) Complete the following table.

Symbol of particle	Electron configuration (use s, p, d notation)	Charge	Atomic number
C1	15 ² 25 ² 2p6 35 ² 3pb 461	0	17
Ca ²⁺	152252p63523p6	+2	20
Mn ²⁺	15252p6353p6 353	+2	25

(b) (i) Define the term electronegativity.

a measure of
electronegativity is an atom's nucleis ability

to attract Aelectrons.

(ii) Explain why the electronegativity of chlorine is greater than that of phosphorus.

CI and P are in the same period.

CI is further right in the table. CI has a

have the same amount of shells therefore the

distance between nuclei and electrons is timilar. CI

thowever was a stronger nuclear charge as it

has more protons to attract the au electrons.

The Even though, CI has more electron-electron

repulsion the strength of the nuclear charge

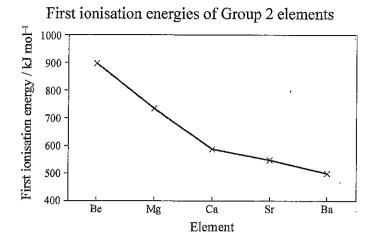

is significantly stronger. Thus the attraction

between nuclei and electrons is stronger which

means, the electronegativity is greater.

(c) The following graph shows the first ionisation energies of the Group 2 elements from Be to Ba.

(i) Write an equation to show the first ionisation energy for the element calcium.

(ii) Explain the trend shown of first ionisation energies of the Group 2 elements.

DEMONDENCE The ionisation energy of you travel goma because as you travel down the size of the molecule increases has the highest - ionisation because the attraction between its nucleas dionost loosely bonded electron another 1 shell. electron relectron repulsion attractive Force less energy raquices fur they Mosina added Glasse thus there cndelectrons) Although the nuclear charge impact everda trend is also

M6

QUESTION TWO

Molecule	Boiling Point / °C	M / g mol ⁻¹	
Hydrazine, N ₂ H ₄	114	32	
Iodomethane, CH ₃ I	42.4	142	
Decane, C ₁₀ H ₂₂	174	142	

Use the information in the table above to compare and contrast the boiling points of the substances below.

In your answers, you should:

- list the types of intermolecular forces present for each substance
- explain the relative strength between the particles involved.
- (a) (i) Hydrazine and iodomethane.

In Hydrazine there are temporary dipole and Hydragen bonding Whereas, localmethane has temporary dipole forces and permanent dipole forces. Hydragen bonding is the strongest intermolecular force and thus requires more energy to break this can be seen in the higher boiling point. I lodomethane has a relatively low Boiling point as the strength of permanent dipole forces ocen't as strong and therefore do not require as much energy to break.

(ii) Iodomethane and decane.

forces & permanent dipole forces as it is a polar molecule a Decane only has temporary dipole forces as it is a polar molecule a Decane only has temporary dipole forces. Decane however has the higher boiling point due to its attiment of the longer chain length. The longer chain means there are more forces to break Eventhaugh the forces are weaker theres more of them, thus, requiring a lot more energy lodomethore has a small chain therefore less every are is required to break less of datas its stronger forces. If

]	Explain why the solubility of hydrazine in water is greater than that of decane in water.
_	Decane is a non-polar molecule that is a very long
	chain. Decane is more attracted to itself than
_	water as water is a polar molecule. Hydrazine, has
-	hydrogen bonding willis between Thus it is
-	more attracted to water than decane is making
-	id more soluble in water.
	y
-	
-	
	Carbon dioxide and water are formed when decane burns completely in oxygen. The reactions shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data:
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_f H^o\left(C_{10}H_{22}(\ell)\right) = -301 \text{ kJ mol}^{-1}$
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_f H^o (C_{10}H_{22}(\ell)) = -301 \text{ kJ mol}^{-1}$ $\Delta_c H^o (C) = -393 \text{ kJ mol}^{-1}$
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_f H^o (C_{10}H_{22}(\ell)) = -301 \text{ kJ mol}^{-1}$ $\Delta_c H^o (C) = -393 \text{ kJ mol}^{-1}$ $\Delta_c H^o (H_2) = -286 \text{ kJ mol}^{-1}$
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_f H^{\circ} (C_{10}H_{22}(\ell)) = -301 \text{ kJ mol}^{-1}$ $\Delta_c H^{\circ} (C) = -393 \text{ kJ mol}^{-1}$ $\Delta_c H^{\circ} (H_2) = -286 \text{ kJ mol}^{-1}$ $C \rightarrow O_2 \qquad \Delta_c H^{\circ} -393$
i	Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_2(g) \rightarrow 10CO_2(g) + 11H_2O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_f H^o (C_{10}H_{22}(\ell)) = -301 \text{ kJ mol}^{-1}$ $\Delta_c H^o (C) = -393 \text{ kJ mol}^{-1}$ $\Delta_c H^o (H_2) = -286 \text{ kJ mol}^{-1}$ $C \rightarrow O_2 \longrightarrow CO_2 \qquad \Delta_c H = -393$ $H_2 + \frac{1}{2}O_1 \longrightarrow H_2O \qquad \Delta_c H = -286$

i (Carbon dioxide and water are formed when decane burns completely in oxygen. The reaction is shown in the equation below. $C_{10}H_{22}(\ell) + 15\frac{1}{2}O_{2}(g) \rightarrow 10CO_{2}(g) + 11H_{2}O(\ell)$ Calculate the enthalpy of combustion for decane, given the following data: $\Delta_{\ell}H^{0} (C_{10}H_{22}(\ell)) = -301 \text{ kJ mol}^{-1}$ $\Delta_{c}H^{0} (C) = -393 \text{ kJ mol}^{-1}$ $\Delta_{c}H^{0} (H_{2}) = -286 \text{ kJ mol}^{-1}$ $C + O_{2} \longrightarrow CO_{2} \qquad \Delta_{c}H^{z} - 393$ $H_{2} + \frac{1}{2}O_{1} \longrightarrow H_{2}O \qquad \Delta_{c}H^{z} - 286$ $11H_{2} + 5C_{2} \longrightarrow C_{10}H_{22} \qquad \text{s. } fH = -301$ $C_{10}H_{22} \longrightarrow C_{10}H_{22} \qquad \Delta_{c}H = 301$ $C_{10}H_{22} \longrightarrow C_{10}H_{22} \qquad \Delta_{c}H = 301$ $C_{10}H_{22} \longrightarrow CO_{2} \qquad \Delta_{c}H = 301$

-6775 KJmol

(d) The reaction for the complete combustion of hydrazine is shown in the equation below. $N_2H_4(\ell)+O_2(g)\to N_2(g)+2H_2O(g)$

ASSESSOR'S USE ONLY

This is an exothermic reaction.

Explain the entropy changes associated with this reaction.

N2H4(1) + O2(g) → N2(g) + 2H2O (g) 15 an
exothermic reaction because the bonds in NoHq (1)
ore breaking to react and form Nzigs and 2H2Ocgs
Buring this reaction the entropy increases as there
4 more disorder amound the particles. There
are 2 restorts to form 3 molecules therefore
there is more chaos. Additionally, the liquid
N2Hq becomes mo gases which has a lot more
disorder as gases don't have intermolecular
forces holding them tagether.

ASSESSOR'S USE ONLY

QUESTION THREE

Chlorine, Cl_2 , bromine, Br_2 , and iodine, I_2 , are all halogens. Bromine is a liquid at room temperature.

In the box below, tick the type(s) of intermolecular attractions in liquid bromine. (a) (i)

Intermolecular attraction	Tick (🗸)
Temporary dipole-dipole attractions	
Permanent dipole-dipole attractions	
Hydrogen bonding	

Explain why bromine is a liquid at room temperature, whereas chlorine is a gas. (ii)

Clz and Brz have only temporary dipole forces batheen the molecules. En bas a thinger nucleur Brz will have stronger ortermolecular then Clz because of its stronger (unclear at room temp because from temp provided, sufficient amount of energy. & But it doesn't

sufficient energy to breek Br. & Porces. of (i)

(b) Write an equation for the sublimation of iodine in the box below.

Iz (s) => Iz (a)

Define the enthalpy of sublimation for iodine.

The energy required to change I mol of Izes into Izeg)

> Question Three continues on the following page.

(iii) Explain why the sublimation of iodine is spontaneous, even though the enthalpy of sublimation is a positive value.

Asub H (Iz) = + value therefore it requires energy

to break bonds to form a gas. Iz(s) -> Iz(g)

can be spontaneous if the enthalpy value is very

small so that room temperature could supply this

amount of energy. This the reaction although requiring

heat to complete can happen almost anywhere

if the surroundings can supply the energy needed.

- (c) Iodine forms a linear I₃ ion.
 - (i) Draw the Lewis structure for the I_3 ion in the box below.

(ii) Explain why the I_3^- ion has a linear shape.

Is has 5 electron clouds surrounding the central I.

atom. This makes the shape trigonal bipyramidal due

to versence Stell electron pair repet. A Bernsea NTS

Is incor varther than bent because

this is how the whence electrons decrease the

amount of repulsion.

(iii) ${\rm IF}_5$ has a square pyramidal shape.

Indicate whether the molecule IF_5 is polar or non-polar.

Circle your choice.

polar

non-polar

Justify your choice.

IFS has 6 electron clouds surrounding the central
I atom. Due to Valence shell Electron pairs repulsion
If s has an acted octenedral shape. However, only
T of the 6 electron clouds are bonded, leaving
one non-bonding. Because of this IF, has a molecular
shape of square pyramid. Illy the I-F bond
has a dipole. I-F sue to the difference in
electronegativity. As IFs in shape of molecule
in not symetrical, the effect of the dipole
Bess is unable to concel Therefore IF5 is
polar.

Sub	ject:	Chem	istry	Standard:	91390	Total score:	15
Q		rade core	Annotation				
1	M6		The candidate understands the factors that affect electronegativity and ionisation energy. However in order to get an excellence level answer for electronegativity, the candidate needs to show understanding that electronegativity involves the attraction of bonding electrons in order to form a bond. In order to earn excellence for ionisation energy, the candidate should recognise that moving down a group increases shielding due to more electron shells, but there is not more electron-electron repulsion within a shell.				for form a should
2	1	The candidate shows some understanding of intermolecular forces. However, they needed to recognise that even though iodomethane is a much larger molecule with more temporary dipole attractions, hydrazine requires more energy due to the strength of the hydrogen bonds. They also needed to realist that although decane has the same molar mass, there are far more electrons therefore far more temporary dipole attractions. Solubility in water is best explained with reference to the strength of attractions between the solvent and solute. The entropy of the reaction requires an explanation of entropy changes in both the system and surroundings in order to be at excellence level.			ger ore orealise ectrons est vent and changes
